

The Case for Progress in the Networked Age

In his new book, "The Case for Progress," Robert Gordon argues that the technological progress that has defined the past two centuries is coming to an end. He points to a number of factors that he believes are contributing to this slowdown, including:

- The increasing complexity of technology
- The decline in investment in research and development
- The rise of inequality
- The aging of the population

Gordon's argument is a provocative one, and it has sparked a great deal of debate among economists and other experts. Some agree with his that progress is slowing down, while others believe that he is too pessimistic.
